

Solar Pool Heating

To maintain comfortable swimming conditions, our pool is now heated with solar energy. In Florida, more than 800,000 homes and businesses have swimming pools. About one-fifth of those pools are heated with solar.

An average sized commercial solar pool heater will reduce a hotel or condominium's carbon footprint by nearly 1000 tons of CO₂ during its useful life.

Solar Fun Facts:

- Solar systems reduce pollution and help combat global warming.
- An average sized commercial solar pool heater compensates for the gasoline used to drive a car more than 140,000 miles.
- Or, said another way, this solar system saves the equivalent CO₂ absorbed by about 25 acres of trees.
